A recent report by the United Nations Children’s Fund (UNICEF) has outlined Uganda as one of the few sub-Saharan countries that have made strides in reducing maternal and child health cases, especially child mortality. The 2018 report titled “Every child alive, the urgent need to end newborn deaths”, indicated that Uganda is the second best country after Rwanda in East Africa, with 21 deaths of every 1,000 babies before their first month.

Maternal and child health

The health ministry indicated that though there are a number of interventions to drop the rates to zero newborn deaths, Districts in West Nile and Acholi are still performing poorly in maternal and child health measures. According to the ministry’s 2018 quarterly District Health Information System on maternal and child health, 19,846 (64%) of the 33,078 pregnant women in Acholi and only 19,846 (60%) of 33,078 women in West Nile go for their fourth antenatal care.

The same report indicated 26,736 (87%) of 30,742 deliveries in Acholi and 25,967 (60%) of 43,549 deliveries in West Nile are attended to at health facilities during reporting period.

The solution

To solve the problem, the district health officers (DHOs) and chief administrative officers (CAO) from Acholi and West Nile have welcomed the project titled Strengthening Maternal, Newborn, Child health and Nutrition (AVSI) Foundation. Volunteers in International Service (AVSI) Foundation, International Development Agency (KOICA) and the Canadian Korea International Co-operation Agency (CIDA).
